QUALITATIVE DATA ANALYSIS REFERENCE

Creating Case Classification Sheets in NVivo

Based on the video tutorial by **Elizabeth Wiredu**

> **What is Case Classification?** 0:17 – 0:53
>
> Case classification is a structured method in NVivo for assigning demographic attributes—such as gender, age, role, or geographic location—to research participants. This setup enables researchers to compare, filter, and analyze qualitative data across distinct subgroups.

1. Creating the Sheet 1:14 – 2:14

Step 1

Navigate to the **Cases** group in the NVivo main navigation panel.

Step 2

Select **Case Classifications** from the sub-menu list (1:14–1:33).

Step 3

Right-click in the working area, click **New Classification**, and enter your sheet name (1:50–2:14).

2. Managing Attributes & Values 3:04 – 5:25

Action / Feature	Timestamp	Description & Workflow
Adding Attributes	3:04 – 3:28	Right-click within the sheet to create a *New Attribute* (e.g., Gender, Role) and specify permissible values (e.g., Male, Female).
Default System Values	3:38 – 3:53	NVivo automatically generates `unassigned` and `not applicable` options for every created attribute.
Moving Attributes	5:01 – 5:25	Use standard cut and paste operations to quickly copy or move attributes across different classification tables.

3. Summary & Next Steps 6:13 – 6:53

Establishing case classification sheets is a critical foundational task in qualitative research project management. Completing this setup prepares your NVivo project for linking coded participant transcripts and nodes directly to demographic attributes during advanced analysis stages.

Key Tip: Ensure attribute values are consistently named before assigning participants to avoid duplicating categories during cross-tabulation queries.
